- nseq Chimeric and humanised versions of anti-EGF receptor antibody 225 for inhibiting tumour growth, esp. of late stage prostatic tumour.

Claim 1, Page 83; 112pp; English.

The present peptide is the complementarity determining region 1 (CDR1) from the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H225, which is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour calls, especially late stage prostatic tumour cells in humans, optionally conjugated a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, rals cycle inhibitor

The invention relates to a method for inhibiting the growth of tumours in human patients by treating with an effective amount of a combination of radiation and a non-radiolabelled protein receptor tyrosine kinase (PRTK) inhibitor, the overexpression of which can lead to tumourigenesis. The method can be used in the treatment of tumours of e.g. breast, lung, colon, kidney, bladder, head and neck, ovary, prostate or brain. The administration of a suitable antibody to the patient makes the tumour more susceptible to radiotherapy
                                                                                                                                                                                                              Hypervariable region; complementarity determining region; CDR; tumour; single chain antibody; growth inhibitor; human; tumourigenesis; therapy; protein receptor tyrosine kinase; heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treatment of human tumors, using a combination of radiation and a non-radiolabeled protein receptor tyrosine kinase inhibitor.

The method involves treating the patient with a combination of EGFR/human EGF-1 (HER1) antegonist, optionally with a chemotherapeutic agent or radiation. The antagonist can be for example a chimeric anti-EGFR monoclonal antibody, C25s. The EGFR/HER1 antagonist is useful for inhibiting the growth of refractory tumours such as tumours of breast, heart, lung, small intestine, colon, spleen, kidney, bladder, head and neck, ovary prostate, brain, pancreas, skin, bone, bone marrow, blood, thymus, uterus, testicles, cervix and liver, preferably squamous cell carcinomas. The present sequence region 1 amino acid sequence of the chimeric anti-EGFR monoclonal antibody C225 which is used in an example illustrating the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                     of a member of the EGF receptor family, or a combination of the antiagonist and photocherapy, chemotherapeutic agent or radiation therapy. The antibody used in the method of the invention acts as an epidermal growth factor receptor (EGFR) antagonist by inhibiting EGFR /HERI phosphorylation. The method of the invention is useful for treating a mammal with hyperproliferative disease such as psoriasis, actinic keratoses, seborrheic keratoses, warts, keloid scars and eczema similated by a ligand of a member of the EGF family of receptor. This sequence represents the murine anti-EGF 255 antibody heavy chain (VH) hypervariable region (CDRI) used as an inhibitor of EGFR in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, TANGO, INTERCEPT, secreted polypeptide; immune disorder;

The invention relates to secreted polypeptide-related proteins and nucleic acids (TANO) and INTERCEPT proteins and nucleic acids). The nucleic acids, proteins and antibodies specific to the proteins are uncleic acids, proteins and antibodies specific to the proteins are useful in screening assays, predictive medicine (e.g. diagnostic assays, prophostic assays, monitoring clinical trials and pharmacogenetics) and diagnosing, preventing or treating proliferative disorders (e.g. andithiple sclerosis or lupus), neurological disorders (e.g. multiple sclerosis or lupus), neurological disorders (e.g. multiple sclerosis or lupus), neurological disorders (e.g. proporters (e.g. multiple sclerosis or lupus), neurological disorders (e.g. proteiner's disease or Parkinson's disease), cardiovascular disorders (e.g. proteiner's disease or Parkinson's disease), cardiovascular conferente disorders (e.g. thromboyycopenia or ansemia) and disorders involving blood vessels (e.g. atherosclerosis or vasculitis). The nucleic acids may also be used in chromosome mapping, tissue typing and forensic polypeptide-related peptide of the invention. Note: The sequence data for this patent was obtained in electronic format directly from USPTO at conferent processed the processed that a secreted conference in the patent of the conference o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid molecule encoding a secreted protein (e.g. TANGO 202, TANGO 201, TANGO 201 or INTERCEPT 217), useful for diagnosing, preventing or treating disorders such as cancer, diabetes or atherosclerosis, and in forensic biology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              arnes TM, Sharp JD, Kirst SJ, Myers PS, Leiby KR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for Synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention. Note: The sequence data for this patent did format directly from EPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        830 Primers useful for synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
The variable region (AAW05823) of the humanised IDIO antibody heavy chain (AAW05829) consists of human IC4 heavy chain variable region framework (substd. at 9 positions with mouse or consensus human amino acids) and complementarity determining regions from the murine IDIO antibody specific for a 28/32 kDa heterodimeric antigen present on the surface of malignant B-cells. It can be coexpressed with humanised IDIO light chain (see also AAW05828) in e.g. mouse myelome NSO cells. Humanised antibody fragments can be incorporated into novel bispecific antibodies reactive Wath both effector cell antigens (see also AAW05820) and malignant B-cells. (Updated on 16-OCT-2003 to standardise OS field)
New bi-specific antibody reactive with both T or NK cells and malignant scells - also their humanised forms and hybridomas producing them, useful for treating or preventing leukaemia, lymphoma and myeloma.

The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAD) #225, 225RHD. The MAD is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                         Heavy chain; reshaped, monoclonal; antibody; 225RD; human; eppldermal growth factor; EGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate; variable region; framework; complementarity determining region; CDR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 31; DB 2; Length 119; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H255, 225RH. The MAD is specific for the human monoclonal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage agent tumour calls in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor

                                                                                                                                                                                                                                                                                       The present sequence is the heavy chain variable region of the reshaped human monoclonal attribody (MAb) H225, 225RHC. The MAb is specific for the human epidermal growth factor (EF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                             Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.

                                                               Heavy chain; reshaped; monoclonal; antibody; 225RB; human; epidermal growth factor; BGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate; variable region; framework; complementarity determining region; CDR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H225, 225RHB. The MAD is specific for the human monoclonal prowth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 31; DB 2; Length 119; 100.0%; Pred. The MAb is specific for the human epidermal growth factor (EGF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells, especially hate stage agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor

The present invention describes a monoclonal antibody (MAb) (I) that binds to a human breast cancer antigen that is also bound by MAb 454C11 and 520C9 (produced hybridoma ATCC HB8484 and HB8696, respectively). Also described is a hybridoma that produces (I). (I) is useful in specific binding assays, affinity purification, drug or toxin targeting, imaging, and genetic or immunological therapeutics for various cancers. The present sequence represents a VH domain derived from a 260F9 hybridoma, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monoclonal antibody capable of binding to human breast cancer antigen useful for affinity purification, drug or toxin targeting, imaging, and

New elongase polypeptides which are functional long chain polyunsaturated fatty acid (PURA) elongase polypeptides are described. The elongase catalyses an elongase reaction to produce PURA (24 carbon fatty acid with at least 4 double bonds) such as di-homo-gamma-linoleic acid (20:3Delta8,11,14), arachidonic acid (20:4Delta5,8,11,14), elocosapentanoic acid (20:5Delta8,11,14), docosatetraenoic acid (22:5Delta3,16,19), docosatetraenoic acid (22:5Delta4,7,10,13,16,19), bURA produced is useful in foodsutifs, dietary supplements and in pharmaceutical compositions which can then be used to elavate PURA levels of an animal or plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated polypeptide comprising functional long chain polyunsaturated fatty acid (PUFA) elongase of Caenorhabditis elegans used to produce PUFA for foodstuff, dietary supplement or pharmaceutical
                                                Elongase; polyunsaturated fatty acid; PUFA; dietary supplement; pharmaceutical; foodstuff; food; di-homo-gamma-linoleic acid; arachidonic acid; elcosapentanoic acid; docosatrienoic acid; docosatetraenoic acid; docosatetraenoic acid; docosapentaenoic acid; docosabentaenoic acid;
              Human sequence (BAC207d4) related to PUFA elongase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure, Fig 10, 42pp, English.

Eur. J. Blochem. 154:153-159(1986).

"Eur. J. Blochem. 154:153-159(1986).

"I FUNCTION: Component of the cuticle of migratory locust which
contains more than 100 different structural proteins.

"I FUNCTION: Component in many proteins constituting the
protective envelope of other species.

"I FIREARY: Contains I cuticle consensus domain.

Nucletc Acids Res. 13:8587-8661(1985).
PUNCTION: Encodes an essential ribose methyltransferase that specifically modifies to 2'-O-methylguanosine a universally conserved nucleotide, G-2270, in the peptidyl transferase center of the mitochondrial large ribosomal RNA (218). This modification seems to be important for the normal accumulation of this latter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EMBL; L19947; AAA74564.1; -.

"The globular head domain of titin extends into the center of the sarcomeric M band. cDNA cloning, epitope mapping and immunoelectron microscopy of two titin-associated proteins.",

J. Cell Sci. 106:319-330 (1993).

-!- FUNCTION: Major component of the vertebrate myofibrillar M band.
Blinds myosin, titin, and light meromyosin. This binding is dose
                                                                                                                                                                                                                                                                                                                                  I.e protein; Thick filament; Repeat.

0

    J. Bacteriol. 183:3293-3302(2001).
    I-FUNCTION: Upptake of uric acid.
    SUBCELLULAR LOCATION: Integral membrane protein (Probable).
    INDUCTION: Expression is very low in excess nitrogen (glutamate plus ammonia) and is nduced during limiting-nitrogen conditions (glutamate). Expression is further induced when allantoin or uric acid are added during limiting-nitrogen conditions.
    SIMILARITY: BELONGS TO THE XANTHINE/URACIL PERMEASES FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-FED-1996 (Rel. 33, Created)

C. -- CARLYTIC ACTIVITY: Endohydrolysis of 1,4-lpha-glucosidic
Linkages in oligosaccharides and polysaccharides.
C. -- CARLYTIC ACTIVITY: Belongs to family 13 of glycosyl hydrolases.
C. -- CIRLARITY: Belongs to family 13 of glycosyl hydrolases.
C. -- SIMILARITY: Belongs to family 13 of glycosyl hydrolases.

Biochem, 47:249-255(1992).

-!- FUNCTION: Reductase activity that acts on ferric iron chelates external to the cell. Plays a role in iron uptake. May participate in the transport of electrons from cytoplasm to an extracellular substrate (ferric ion) via FAD and heme intermediates. May also participate in Cu(II) reduction and Cu(I)

-!- SUBCELLULAR LOCATION: Nuclear (Probable).
-!- TISSUE SPECIFICITY: Specific to the nervous system of both embryos and adults. Highest levels in the cortical plate of the cerebrum.
-!- SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.

TITLE OF INVENTION: ANTIBODY AND ANTIBODY FRAGMENTS FOR
INFIBITING THE GROWTH OF TUMORS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LENGTH: 119 amino acids
TYPE: amino acid
STRANDEDNESS: not relevant
TOPOLOGY: not relevant
MOLECULE TYPE: peptide
HYPOTHETICAL: NO
FRAGMENT TYPE: internal
SEQUENCE DESCRIPTION: SEQ ID NO: 116:
US-10-374-600-116
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         31 NYGVH 35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence Seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence Sequence 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-02-39/-411-6
) Sequence 6, Application US/08397411
) Patent No. 6129914
) GENERAL INFORMATION:
APPLICANT: Gingrich, Roger
APPLICANT: Link, Batan
APPLICANT: Link, Batan
TITLE OF INVENTION: Bispecific Antibody Effective to Treat
TITLE OF INVENTION: B-Cell Lymphoma and Cell Line
NUMBER OF SEQUENCES:
ADDRESSEE: Townsend and Townsend and Crew
STREET: One Market Plaza, Steuart Tower, Suite 2000
CITY: San Francisco
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 31; DB 4; Length 265; 100.0%; Pred. No. 55; 0; Indels cive 0; Mismatches 0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 2, Application US/08211430

Patent No. 5763166

GENERAL INFORMATION:
PAPLICANT:
TITLE OF INVENTION: X CHROMOSOME LINKED KALLMANN SYNDROME, CORRESPONDING
TITLE OF INVENTION: X CHROMOSOME LINKED KALLMANN SYNDROME, CORRESPONDING
TITLE OF INVENTION: PEPTIDE SEQUENCES, DIAGNOSTIC APPLICATIONS.
NUMBER OF SEQUENCES: 32
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25 (BPO)
CURRENT APPLICATION DATA:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Saldanha JW; Goldstein NI, Giorgio NA, Jones ST,

WPI; 1997-051897/05.

Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.

Claim 1; Page 83; 112pp; English.

The present peptide is the complementarity determining region 2 (CDR2) from the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H225, which is specific for the human epidemial growth factor (EGP) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or displatin, or a signal transduction, ras or cell cycle inhibitor

Sequence 16 AA;

Anti-EGFR monoclonal antibody H chain V region CDR2 peptide sequence.

                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is the hypervariable region CDR2 (complementarity determining region 2) of the heavy chain of a single chain antibody derived from the murine antibody 225. The invention relates to a method for inhibiting the growth of tumours in human patients by treating with an effective amount of a combination of radiation and a non-radiolabelled protein receptor tyrosine kinase (PRTK) inhibitor, the overexpression of which can lead to tumourigenesis. The method can be used in the treatment of tumours of e.g. breast, lung, colon, kidney, bladder, head and neck, ovary, prostate or brain. The administration of a suitable antibody to the patient makes the tumour more susceptible to radiotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hypervariable region, complementarity determining region, CDR, tumour; single chain antibody, growth inhibitor; human, tumourigenesis; therapy, protein receptor tyrosine kinase, heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treatment of human tumors, using a combination of radiation and a non-radiolabeled protein receptor tyrosine kinase inhibitor.

This invention relates to a method for inhibiting the growth of refractory tumours that are stimulated by a ligand of epidermal growth the acctor receptor (EGRN) in human patients. The method involves treating the patient with a combination of EGRN/human EGF-1 (HERRI) antagonist, optionally with a chemotherapeutic agent or radiation. The antagonist can be for example a chimeric anti-EGRN monoclonal antibody, CZS2. The EGRN/HERI antagonist is useful for inhibiting the growth of refractory tumours such as tumours of breast, heart, lung, small intestine, colon, spleen, kidney, bladder, head and neck, ovary, prostate, brain, pancreas, skin, bone, bone marrow, blood, thymus, uterus, testicles, cervix and liver, preferably squamous cell carcinomas. The present sequence represents the heavy chain variable region complementarity determining region 2 amino acid sequence of the chimeric anti-EGFR monoclonal antibody CZS5 which is used in an example illustrating the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                              d
```

```
The present peptide is the complementarity determining region 2 (CDR2) from the heavy chain variable region of the reshaped human monoclonal antibody (Wab) H225, which is specific for the human epidermal growth factor (EGF) receptor. The Mab, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell
                                                                                                                                                                                                                                                                               Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heavy chain; reshaped; monoclonal; antibody; 225RD; human; papidermal growth factor; BGF; receptor; inhibition; growth; late stage; prostatic; prostate; variable region; framework; complementarity determining region; CDR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel method for treating a mammal with hyperproliferative disease stimulated by a ligand of a member of the epidermal growth factor (EGF) family of receptors. The method involves administering an antibody or a defective receptor that is an antagonist of a member of the EGF receptor family, or a combination of the antagonist and phototherapy, chemotherapeutic agent or radiation therapy. The antibody used in the method of the invention acts as an epidermal growth factor receptor (EGFR) antagonist by inhibiting EGFR /HERI phosphorylation. The method of the invention is useful for treating a mammal with hyperproliferative disease such as psoriasis, actinic stimulated by a ligand of a member of the EGF family of receptor. This sequence represents the mutine anti-EGF 255 antibody heavy chain (Wh) hypervariable region (CDR2) used as an inhibitor of EGFR in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Complementarity determining region 2; CDR2; heavy chain, variable region; reshaped; human; monoclonal; antibody; H225; epidermal growth factor; EGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate.
                                                                                                                                                                                                                                                                                                                                                                                                           Treating a mammal with hyperproliferative disease especially psoriasis, stimulated by ligand of member of epidermal growth factor family of receptors, by administering antagonist of the receptor.

                                                                                                                                                                                          The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H225, 225RHD. The MAD is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour calls, especially late stage prostatic tumour calls in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                             Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.

                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAb) H225, 225RHA. The MAb is specific for the human epidermal growth factor (EGF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Heavy chain; reshaped; monoclonal; antibody; 225RC; human; epidermal growth factor; BGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate; variable region; framework; complementarity determining region; CDR.

```

```
The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H225, 225RHB. The MAD is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Heavy chain; reshaped; monoclonal; antibody; 225RE; human; epidermal growth factor; EGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate; variable region; framework; complementarity determining region; CDR.
                                                                                                                                                                                                                                Chimeric and humanised versions of anti-EGF receptor antibody 225 for inhibiting tumour growth, esp. of late stage prostatic tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                 The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAb) H225, 225RHC. The MAb is specific for the human epidermal growth factor (EGF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                      Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.

The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAb) H225, 225RHA. The MAb is specific for the human epidermal growth factor (EGF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
for inhibiting tumour growth, esp. of late stage prostatic tumour.

                                                                                                                                                                                                                                 The present sequence is the heavy chain variable region of the reshaped human monoclonal antibody (MAD) H225, 225RHE. The MAD is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heavy chain; reshaped; monoclonal; antibody; 225RA; human; epidermal growth factor; EGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate; variable region.

The MAb, or a fragment, can be used to thinbit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytocoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras

scFv(225) (AAW05133) comprises the single-chain binding region of murine monoclonal antibody 225, which is specific for the human epidermal growth factor receptor. It is encoded by plasmid pWW152-225 (see also AAT42033), constructed by cloning MAD 225 WH and VL region cDNAs into plasmid pWW152. Novel bivalent proteins (see also AAW05134-44), some of them including scFv(225) and an effector e.g. cytotoxin, can be produced in bacterial host cells, and are useful as antitumour agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bivalent fusion proteins that bind epidermal growth factor receptor analogues - and comprise at least two different cell surface binding domain(s), useful for tumour therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 88; DB 2; Length 240;

The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stages prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor. (Updated on 27-AUG-2003 to correct OS field.)

scFv(225)-ETA (AAW05135) comprises the single-chain binding region (see also AAW05133) of murine monoclonal antibody 225, which is specific for human epidedrmal growth factor receptor, joined to exotoxin A (ETA). It is encoded by plasmid psw202-225 (see also AAT42035) obtd. by ligating an scFv(225) gene (AAT42033) into plasmid psw200 contg. the Pseudomonas acruginosa PAK ETA gene. The construct can be used to produce novel bivalent fusion proteins (see also AAW05136-44) in bacterial host cells, for use as antitumour agents
Single chain antibody; scFv; monoclonal antibody; MAb; EGF; epidermal growth factor; receptor; plasmid pSW202-225; cancer; therapy; antitumour; exotoxin A; ETA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bivalent fusion proteins that bind epidermal growth factor receptor or analogues - and comprise at least two different cell surface binding domain(s), useful for tumour therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
